Introduction

The *Census of the Vascular Plants of Tasmania* is a checklist of every native and naturalised vascular plant taxon for which there is physical evidence of its presence in Tasmania. It includes the correct nomenclature and authorship of the taxon's name, as well as the reference of its original publication.

According to this *Census*, the Tasmanian flora contains 2727 vascular plants, of which 1921 (70%) are considered native and 806 (30%) have naturalised from elsewhere. Among the native taxa, 533 (28%) are endemic to the State. Forty-eight of the State's exotic taxa are considered sparingly naturalised, and are known only from a small number of populations. Twenty native taxa are recognised as extinct, whereas eight naturalised taxa are considered to have either not persisted in Tasmania or have been eradicated. The sub-Antarctic Macquarie Island, considered part of Tasmania, supports 50 species of vascular plants, of which 42 are considered native and eight naturalised (two of these have since been erradicated). For some basic statistics on the Tasmanian flora see Tables 1–3.

The 2020 edition of the *Census* contains six new additions to the State's Flora: *Pterostylis straminea*, which replaces *P. plumosa* in Tasmania; *Pseudanthus divaricatissimus*, a population of which was mistakenly called *P. ovalifolius* in previous editions; three new *Lagenophora* species split from existing ones; and *Acacia acinacea*, recently discovered as a healthy population in Bruny Island (Appendix 1a). The names of seven taxa have changed since the previous edition (Appendix 1b). *Xerochrysum bracteatum* has had its status changed from native to naturalised since the previous edition (Appendix 1c). Seven taxa are no longer considered part of the Tasmanian flora. Four of these were previously considered naturalised, although no evidence exists that they have ever formed self-sustaining populations.

The *Census* incorporates every name (including synonyms) used to refer to Tasmanian plants in the major taxonomic publications about Tasmania, and aims to account for every species name attributed to Tasmania, whether erroneously or correctly. Names from the following publications have been included:

- Jacques-Julien Houtou de Labillardière's *Novae Hollandiae Plantarum Specimen* (1804-1807);
- Robert Brown's *Prodromus Florae Novae Hollandiae et Insulae van-Diemen* (1810);
- Joseph Dalton Hooker's *The Botany of the Antarctic Voyage of H. M. Discovery Ships Erebus and Terror in the Years 1839 - 1843 Under the Command of Captain Sir James Clark Ross. Part III: Flora Tasmaniae* (1855-1859, complete work published in 1860);
- all volumes of George Bentham's *Flora Australiensis* (1863-1878); and
- Leonard Rodway's *The Tasmanian Flora* (1903).

In addition, all names used in Cheeseman's (1919) *The Vascular Flora of Macquarie Island* have been accounted for in the Macquarie Island section.

The classification systems used in this *Census* follows APG IV (2016) for flowering plants (Angiosperms) and McCarthy (1998) for conifers, ferns and their allies. In contrast, the system used to arrange the botanical collections of the Tasmanian Herbarium and in the *Flora of Australia* series, which is published by the Australian Biological Resources Study (ABRS), follows Cronquist (1981), and the *Flora of Tasmania Online* (de Salas 2009+) follows the older APG II (2003) system. To determine the families in which genera are placed in this edition, please refer to Appendix 2 at the end of this document.

This *Census* also serves as an index to *The Student's Flora of Tasmania* (Curtis 1963, 1967, 1979; Curtis & Morris 1975, 1994). Species accounts can be found in *The Student's Flora of Tasmania* by referring to the volume and page number reference that is given in the far right column (e.g. 3:539). Families with accounts completed in the *Flora of Tasmania Online* (de Salas 2009+) are highlighted at the family entry (e.g. FTO 1).

Acknowledgments

This checklist was developed using BRAHMS (Botanical Research And Herbarium Management System) database management system. The authors would like to thank the BRAHMS team for making possible (and infinitely easier) the publication of an annual up-to-date census. In addition the authors would like to thank the APC (Australian Plant Census) group, whose work brings to our attention a myriad of taxonomic updates we might otherwise miss. We would like to thank Lynette Cave of the Tasmanian Herbarium for her assistance in checking the validity and publication details of numerous taxa. Mark Wapstra (ECOtas) provided useful comments on a draft of this publication and for these we are grateful.

Symbols used in species list

- e endemic in Tasmania
- t within Australia, occurs only in Tasmania
- x considered by the Tasmanian Herbarium to be extinct or eradicated in Tasmania or Macquarie Island
- i introduced and naturalised in Tasmania
- # sparingly naturalised or known from only one or two populations or collections
- * doubtfully naturalised: collections exist but no evidence exists to establish that this taxon is naturalised in Tasmania
- n a change since the 2019 edition (see Appendix 1 for summary)

no symbol indicates that the taxon is native both in Tasmania and the Australian mainland

NOTE: This *Census* no longer includes information on the listing status of species listed on the Tasmanian *Threatened Species Protection Act 1995*, the *Commonwealth Environment Protection and Biodiversity Conservation Act 1999*, or the Tasmanian *Weed Management Act 1999*. For this information please refer to current legislation.

APPENDIX 1: CHANGES IN THE CENSUS BETWEEN THE 2019 AND 2020 EDITIONS

1D: TAXA NOW NOT CONSIDERED TO BE PART OF THE TASMANIAN FLORA

EUDICOTS

ASTERACEAE

Lagenophora huegelii (previously misapplied in Tasmania, see Wang & Bean 2019)

BORAGINACEAE

i * Amsinckia lycopsoides

i * Myosotis scorpioides

i * Nonea lutea

GENTIANACEAE

Gentianella cunninghamii (The only known Tasmanian record is most likely misattributed, as the collector spent a considerable amount of time in southern NSW where this taxon is native)

SALICACEAE

i * Salix matsudana 'Tortuosa'

MONOCOTS

ORCHIDACEAE

Pterostylis plumosa (Tasmanian populations now considered to belong to Pterostylis straminea)
